

Feature 1: Fetch tools released by big companies

Don't use paid APIs.

Instead, maintain a `companies` table:

```
OpenAI
Google AI
Anthropic
Microsoft AI
Meta AI
Perplexity
Cursor
Runway
ElevenLabs
Suno
Lovable
Canva AI
Figma AI
```

Sources to monitor

1. RSS feeds (FREE)

Most companies expose:

- Blog RSS
- Changelog RSS
- Release notes RSS

Example:

```
OpenAI Blog
Google AI Blog
```

Anthropic News

Run a cron job every hour:

```
for company in companies:
    fetch_rss(company.rss_url)
    save_new_articles()
```

2. Official blogs and release pages

Some companies don't have RSS.

Scrape:

```
/blog
/news
/releases
/changelog
/announcements
```

Libraries:

```
Python:
BeautifulSoup
Playwright
newspaper3k

Node:
Cheerio
Playwright
Puppeteer
```

3. GitHub Releases (FREE)

Many AI companies release tools on GitHub.

Use:

```
GET https://api.github.com/repos/{owner}/{repo}/releases
```

Examples:

```
microsoft/autogen  
langchain-ai/langchain  
crewAIInc/crewAI
```

GitHub API has generous free limits. ([GitHub](#))

How to automatically add tools

When a new article is detected:

```
OpenAI releases Codex Workspace  
↓  
Send article text to Gemini  
↓  
Extract:  
- Tool name  
- Description  
- Category  
- Pricing  
- Website  
- Company  
↓  
Insert into database
```

Feature 2: Trending on social media

This is harder because most social APIs are limited.

Reddit (Mostly Free)

Subreddits:

```
r/artificial
r/ChatGPT
r/singularity
r/MachineLearning
r/LocalLLaMA
r/ClaudeAI
```

Every hour:

```
Search:
"GPT"
"Claude"
"Cursor"
"Veo"
```

Collect:

```
posts_count
upvotes
comments
```

Reddit's commercial API access is restricted, so many developers rely on public JSON endpoints or scraping for small projects. ([Wikipedia](#))

Hacker News (Completely Free)

API:

```
https://hacker-news.firebaseio.com/v0/
```

Fetch:

```
topstories
newstories
```

Calculate:

```
score
comments
mentions
```

GitHub Trending (Free)

Track:

```
stars gained
forks
release activity
```

A repository suddenly gaining stars usually indicates an emerging tool.

Feature 3: Internet trending

This is where your site becomes powerful.

Google Trends

There is now an official Trends API in limited testing, but most developers still rely on unofficial libraries or the Trends website itself. ([Google for Developers](#))

Use:

```
pytrends
```

Example:

```
pytrends.build_payload(
    ["ChatGPT", "Claude", "Cursor"]
)
```

Get:

```
interest_over_time
related_queries
rising_queries
```

Free.

Google News RSS (FREE)

Example:

```
https://news.google.com/rss/search?q=ChatGPT
```

Get:

```
articles_count
publishers
timestamps
```

Google News RSS can be used as a lightweight free news source. (newscatcherapi.com)

GDELT (100% Free)

Probably the most underrated source.

API:

```
https://api.gdeltproject.org/api/v2/
```

Provides:

```
news mentions
global coverage
article URLs
timestamps
```

Updates roughly every 15 minutes. (newscatcherapi.com)

Trending Score

```
score =  
0.30 * google_trends +  
0.25 * reddit_mentions +  
0.20 * news_mentions +  
0.15 * github_growth +  
0.10 * youtube_mentions
```
